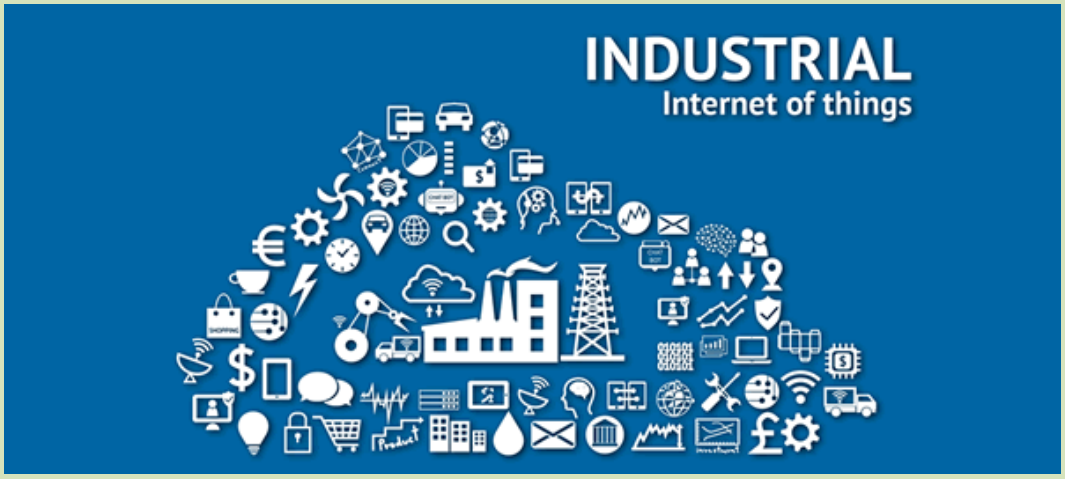
How IIOT resolves industrial needs

The Industrial Internet of Things originally described IoT (Internet of Things) as it is used across several industries such as manufacturing (Industry 4.0), logistics, oil and gas, transportation, energy/utilities, mining and metals, aviation and other industrial sectors and use cases which are typical to these industries.



Although most Industrial IOT projects are about automation, optimization and tactical or strategic goals in a mainly internal context – and will continue to be in 2018 and beyond, we've seen some really transformational IIOT projects as well. More about the initial goals of many IIOT projects below. For now, back to what the Industrial IOT is.

Industrial IOT in the earlier mentioned sense was mainly used to make a distinction between the use cases, actual usage and specific technologies as leveraged for initially mainly manufacturing and, later, other industries on one hand and enterprise IOT and consumer IOT applications on the other.
